

1. Explain the difference between the `==` operator and the `===` operator.  
With the `===` operator you prevent any conversion of variables, while the `==` operator allows such conversion.

2. Explain what a closure is. (Note that JavaScript programs use closures very often).  
A closure is a feature that makes it possible to pass variables outside a function.

3. Explain what higher order functions are.  
Higher order functions are function where other functions can be executed on.

4. Explain what a query selector is and give an example line of JavaScript that uses a query selector.  
A query selector gets a selector string and returns it as an array like object. An example of a query selector is `object.document.querySelector("img")`.
