Style choices week 5

For this week, I have chosen to get the climate data of Amsterdam and Kuopio. However, to get the x-axis working I needed to work with a date so therefore I created an artificial date. To get the average temperature, I made an average between the minimum and maximum temperature.

Furthermore, I have chosen to give the maximum temperature line a red colour, because red is usually associated with warmer temperatures. The minimum temperature has a blue colour because of similar reasons and the average temperature is grey because it is in between the two and therefore not a very striking data point so I have chosen for a more mild colour.

The crosshair is purple because it is a merge between red and blue.
